

Guidelines for Trauma Patient Receiving Tranexamic Acid (TXA) from Pre-Hospital Provider

1. Upon patient's arrival to resuscitation primary assessment will be initiated.
2. Source of bleeding identified and blood products administered as deemed appropriate.
3. The patient may need to go to the OR for bleeding control.
4. The decision to administer the second dose of TXA will be determined by the attending surgeon.
5. TEG6s global hemostasis with LYSIS, **must** be ordered in the ED as part of initial laboratory works.
6. Consider using TXA only if when TEG lysis is elevated
